Arkiv pitch: 3-minute script

Track: **Build on Arkiv (from scratch)** · deck: `docs/pitch/arkiv-deck.html` (press **p** to present, arrows to move) · ~400 words at a calm pace.

The first 30 seconds: the problem (say it word for word):
"Robots are about to work for hire: cleaning homes, inspecting warehouses. But a robot's track record will belong to whoever runs the platform. A failed job can be deleted, a score edited, an incident hidden. Customers, robot owners and the people who sell AI agents to robots have no shared record that none of them controls. That's what we fixed with Arkiv."

Minute by minute

Time	Slide	Say	Show / point at
0:00–0:30	1 · Problem	The problem paragraph above.	Let the headline sit; no bullet points.
0:30–0:50	2 · What we built	"Semmal is a robot-for-hire marketplace where the robot signs its own record on Arkiv. Three things matter: the robot owns its record, scores from that record choose who gets work, and expiry does our coordination."	The three numbered cards.
0:50–1:30	3 · Robot owns its record	"The robot has its own key, made on the robot PC. It writes its quotes, the agents it hires, every job and incident as Arkiv entities it owns. Readers only count a record if owner, creator and the wallet inside match the robot's registered wallet. So not even its owner can edit or withhold it. Live: seven episodes and twenty-one incidents signed by this robot."	The three-step flow; the live numbers.
1:30–2:10	4 · Scores choose who gets work	"After each job the robot scores itself and every agent it paid, and writes the job score as an indexed column. Those signed scores rank robots for customers and agents for robots. Anyone can recompute them with one query. Here, task score 100, part by part."	The query output.
2:10–2:40	5 · Expiry	"Bookings, quotes and job claims expire at their own deadline, so stale offers clean themselves up. Unmaintained registrations lapse. And every booking shows what went to Arkiv, read back from Arkiv."	The three numbers; mention 'What went to Arkiv'.
2:40–3:00	6 · Close	"Swap Arkiv for Postgres and users lose a robot record they don't have to trust us for. The schema, friction and reach files are in the repo. That's Semmal."	Links.

Deliverables to point at (Arkiv track)

Requirement	Where
Writes to Arkiv's testnet with the SDK; a user-visible feature reads it	8 schemas on Rabdi; booking map, agent market, orders, evidence, "What went to Arkiv"
README: writer wallet addresses + one query	README → "ETHGlobal Mumbai submission"; `pnpm arkiv:query`
/arkiv/schema.md and /arkiv/friction.md	`arkiv/schema.md`, `arkiv/friction.md`
One file per criterion	`arkiv/reach.md`, `arkiv/why-arkiv.md`, `arkiv/how-you-use-arkiv.md`
Public repo, open-source licence, AI use stated	github.com/jonathanvineet/semmal · MIT · README "How AI was used"

Likely questions

- **Why not a contract?** We need queryable records with owners and lifetimes, not logic; Arkiv gives us filters and expiry; payments are plain 0G transfers.
- **Can a robot lie?** Arkiv proves who wrote what and when, not that a sensor was right. The robot's identity is a signed challenge from its own key at registration.
- **What's off Arkiv?** Live position, exact addresses, camera frames, sessions, keys (see why-arkiv.md).
